

Please explain why the operational description suggests capability up to 2700 MHz. What will preclude use in the other bands (i.e. WLAN 2.4, WMAX 2.5, etc.). Will these be implemented at a later time? Please provide further detail.

The 3000 DAS system is designed to be able to provide operation of a number of services over a wide range of frequencies.

At present, there is no customer requirement for operation in unlicensed bands in the USA.

There are current customer requirements for Wi-Fi operation in Europe. Should there be a customer requirement for Wi-Fi operation in USA, a further set of tests and new certification application will be made for operation of the 3000 system with a specific Access Point.

Should other services such as WiMAX be requested in the future then additional testing and certification will be carried out as required.

Regards

Charlie
